                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                            Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide #6360 encoded by probe for measuring placental gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, brain expressed exon; gene expression analysis; probe; microarray; Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Human brain expressed single exon probe encoded protein SEQ ID NO: 31599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhols, sedentified may be hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence but was obtained in electronic format directly from WIPO at fire. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 31538; 634pp; English.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung compitating single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exors in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably albeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon show and (b) measuring the expression of each of the exons in several comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in the tissues and/or cell types using hybridisation to a single exon several comprising the exons should be assigned to a single gene; a peptide comprising of the exons should be assigned to a single gene; a peptide comprising compression of the exons in the tissues and/or cell types using hybridisation, or encoded by the probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human analysis, and for identifying exons in a gene, particularly using human analysis, and for the study of lung diseases such as athma, lung derived manalysis, and for the study of lung designed to a single

New NOVX polypeptide useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics.

tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histocytosis, lymphangiolelomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; NOVX, cytostatic; cardiant; antiinflammatory; immunosuppressive; antiallergic; haemostatic; anti-HIV; antidiabetic; antiarteriosclerotic; antiarteriosclerotic; antiarteriosclerotic; neuroscotic; antiarteriosclerotic; neuroprotective; nootropic; antibacterial; virucide; antiparasitic; relaxant; anticonvulsant; hypotensive; vasotropic; antiparkinsonian; vulnerary; angiogenic; antiangiogenic; gene therapy; vaccine; cardiomyopathy; atherosclerosis; hypertension; diabetes; inflammation; autoimmune disorder; allergy; blood disorder; AIDS; obesity; asthma; acquired immunodeficiency syndrome; nephropathy; cirrhosis; arthritis; Alzheimer's disease; Parkinson's disease; goitre; infection; stroke; muscular dystrophy; epilepsy; wasting disorder; chromosome 12.

ACT 99126 to ARC59105 encode the human secreted proteins (I) given in ABR56726 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can harbstatic, antiarterisoclerotic, anticonvulsant, antialflammatory, nootropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic and thyromimetic activities, and can be used in gene therapy. The SECP proteins and polymucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased or proteins and polymucleotides can be used in diagnosing, treating and preventing diseases or conditions associated with the decreased or expression or overexpression of SECP, such as cell proliferative (e.g. expression or overexpression of SECP, such as cell proliferative (e.g. cancer, atherosclerosis), immune/inflammatory (e.g. AIDS, allergies) and disease, stroke, immune/inflammatory (e.g. AIDS, allergies) and campounds on the expression of nucleate acid and anino acid sequences of SECP. The SECP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polymucleotide and compounds that specifically bind to or modulate the activity of the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                        New human secreted proteins (SECP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant SECP expression e.g. cancer, AIDS, atherosclerosis, Huntington's disease, stroke, infections.

                                                                                                                                                                                                                                                                                                                                                         N-PSDB; ACC79069
                                                                                                                                                                                                                               Borowsky M
Becha SD,
ACK ACF03547 to ACF03570 encode the human NOVX proteins (I) given in ABR57412 to ACF03547 to ACF03570 encode the human NOVX proteins (I) have cytostatic, cardiant, antinflammatory, nootropic, immunosuppressive, antiallary, antidiabetic, antiatrearlosclerotic, antiathmatic, antiathmatic, reputedict, antiathmatic, notropic, antiparterial, relaxant, antiparasitic, netronvalsant, hypotensive, antibacterial, relaxant, antiparasitic, anticonvalsant, hypotensive, antibacterial, relaxant, cartiparasitic, anticonvalsant, hypotensive, antibacterial, relaxant, of antiparasitic, anticonvalsant, hypotensive, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (I) in a sample. The NOVX polypeptides, polymocleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorders, asthma, inflammation, cardiomyopathy, atheroscleosis, blood disorders, obesity, acquired immunodeficiency syndrome (ADS), immunoglobulin (Ig) A nephropathy, clirchosis, arthritis, Alzheimer's disease, Parkinson's disease, actions, and other wasting disorders associated with chronic diseases. ACF03571 to ACF03544 stopersent por present invention sequence, which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

The invention relates to the human atopic dermatitis-inducing proteins, salivary acidic proline-rich phosphoprotein (PRP; ADC92216) and prolactin chandrale protein (PIP; ADC9218), and their post-translationally modified forms. These proteins are secreted by salivary or sweat glands and bind to IgE autoantibodies, thereby activating mast cells and bind to IgE autoantibodies, thereby activating mast cells and proper properties or lates to antigenic peptide fragments of PRP or PIP; antibodies which bind to PRP or PIP; methods for diagnosing atopic dermatities by determining the presence of PRP- or PIP-specific antibodies or immune complexes, or by quantifying histamine release; and sensitisation remedies for atopic dermatities on their peptides as the active injected. PMP, PIP and their antibodies are useful in diagnosing atopic dermatities. Or for determining whether an individual is at risk of developing atopic dermatitie. They are also useful in diagnosing actopic dermatitie. They atopic dermatities. The present sequence represents the specifically actopic dermatities. The present sequence represents the specifically claimed human salivary acidic proline-rich phosphoprotein (PRP).
                                                                                                                                                                                  Atopic dermatitis-inducing proteins, applicable in diagnosis of including risk of onset, and in developing sensitization remedies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, PRP-1; proline-rich protein, saliva, dental caries,
chromosome 12p13.2; arginine catabolism, ammonia production, pH increase,
oral bacterium, caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human saliva PRP-1 fragment (residues 101-108), SEQ ID NO:9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-MAR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23-NOV-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB48779;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 14
     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tags (1871s) known to be expressed in the phenotype/cell type of interest with all ESTs expressed in normal tissue of interest hat are preferentially expressed in the phenotype/cell type of interest had a marker for a predetermined phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably arbidopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress-induced phenotype such as hyperosmotic stress or high salt conditions. A method of the invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is useful for detecting the absence or presence of peptides encoded by tumour associated markers. A polypeptide of the invention is useful as an immunogen for vaccinating an animal. The present sequence represents a tumour associated antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, salivary acidic proline-rich phosphoprotein, FRP, autoantigen, atopic dermatitis-inducing protein, salivary gland; ISB autoantibody; immunoglobulin E, mast cell activation, basophil activation; diagnosis, risk assessment; sensitiastion remedy; dermatological; antiallergic,
                                                                                                                                                                                                                                         Determining if a nucleic acid is a marker for a phenotype/cell type of interest, by global comparison of expressed sequence tags known to be expressed in the phenotype/cell type with all ESTs expressed in normal
                                                                                                          Lobashev AV, Krukovskaya LL;

```
The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12pl3.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oard bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a bropionibacterium annes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM6436) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host comprising a additionally encompasses expression vectors and host comprising a polynucleotide of the invention; antibodies against polypeptides of the invention; and polyneptides of the invention; and polyneptide of the invention; and polyneptides of the invention; and polyneptide of the invention; and polyneptides of the poly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Acne vulgaris; antiseborrhoeic; dermatological; antibacterial; immunostimulant; immune response; vaccine; immunogenic.
   proline-rich proteins, useful for preventing dental caries.

method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigan-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a proteins, T cell populations or antigan-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acnes polypeptides are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the crimilation of an immune response against P. acnes polypeptide which is sequence represents a specifically claimed P. acnes polypeptide which is thought to contain an immunogenic region. Note: The sequence data for the primed in electronic forma part of the printed specification, but was the various or the vari

Listing first 45 summaries

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

T. "Combined restriction landmark genomic scanning and virtual genome scans identify a novel human homeobox gene, ALX3, that is hypermethylated in neuroblastoma.";

T. Genes Chromosomes Cancer 33:285-294(2002).

C. - FUNCTION: Transcriptional regulator with a possible role in patterning of mesoderm during development (By similarity).

C. -- SUNCELLULAR LOCATION: Nuclear (By similarity).

C. -- SUNILARITY: Belongs to the paired homeobox family.

C. -- SIMILARITY: Contains 1 homeobox domain.

Dev. Biol. 199:11-25 (1998).

-!- FUNCTION: Transcriptional regulator with a possible role in patterning of mesoderm during development.
-!- SUBCELIUIAR LOCATION: Nuclear (By similarity).
-!- SUBCELIUIAR LOCATION: Nuclear (By similarity).
-!- TISSUE SPECIFICITY: Predominantly in neural crest-derived mesenchyme and in lateral plate mesoderm. Prominent expression in frontonasal head mesenchyme and in the first and second pharyngeal arches and some of their derivatives. High expression is also seen in the tail and in many derivatives of the lateral plate mesoderm in the tail and in many derivatives of the lateral plate mesoderm including the limbs, the body wall, and the genital tubercle.
-!- DEVELOPMENTAL STAGE: Expressed in embryos from 8 days of gestation
                                                                                                                                                                                                                                                                                                                                                           16-OCT-2001 (Rel. 40, Created)

Expression, Purification and characterization of recombinant mouse
NTS-MMP protein products.";
FEBS Lett. 462:261-266(1999).
-! FUNCTION: Activates progelatinase A. May also be a proteoglycanse
involved in degradation of proteoglycans, such as dermatan sulfate
and chondroitin sulfate proteoglycans. Cleaves partially
fibronectin, but not collagen type I, nor laminin.
-! COPACTOR: Binds I zinc ion per subunit, calcium (By similarity).
-! SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN ALSO SHED FROM CELL
SURFACE AS SOLUBLE PROTEINASE, BY A PROTEOLYTIC CLEAVAGE.
-! TISSUE SPECIFICITY: Expressed in brain. Expressed at low level in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      characterization of the fifth membrane-type matrix
                                                                                                                                                                                                                                                                                                                                  Selfu M.; "Identification of a new membrane-type matrix metalloproteinase, MTS-MMP, that is expressed predominantly in cereballum."; Submitted (DEC-1998) to the EMBL/GenBank/DDBJ databases.

                                                   -!- CATALYTIC ACTIVITY: L-2-aminohexanedioate + L-cysteine + L-valine + 3 ATP = N-[L-5-amino-5-carboxypentanoyl]-L-cysteinyl-D-valine + 3 AMP + 3 diphosphate.
-!- COFACTOR : Contains 3 covalently bound phosphopantetheines.
-!- PATHWAY: Biosynthesis of penicillin and cephalosporin; first step.
-!- PATHWAY: Belongs to the ATP-dependent AMP-binding enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         070152; Q9D829;

Pul., Scocca J.R., Walker B.K., Wu J.S., Krag S.S.;
T. Mandation in B4-2-1 GHO cells defective in MpD synthase activity.";
T. Mandation in B4-2-1 GHO cells defective in MpD synthases.
T. Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.
T. FUNCTION: Transfers mannose from GDP-mannose to Golichol
monophosphate to form dolichol phosphate mannose (Dol.P-Man) which
T. Stycosyl phosphatidylinositol membrane anchoring, and O-
mannosylation of proteins (By similarity).
T. CAPALKITC ACTIVITY: GDP-mannose + dolichyl phosphate = GDP +
dolichyl D-mannosyl phosphate.
T. CAPALKITON: Endoplasmic reticulum (By similarity).
T. SIMILARITY: Belongs to the glycosyltransferase family 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.

Claim 4; Page 24; 36pp; English

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12pl3.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia the catabolism of arginine the ammonia of the converted to ammonia by these bacteria.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #6360 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                  Claim 27; SEQ ID NO 31483; 639pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPS (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia Via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
      arginine catabolism; ammonia production; pH increase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human genome-derived single exon nucleic acid probes useful for analyzing
                                 The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, bone marrow expressed exon; gene expression analysis; probe; microarray; cancer; leukaemia; lymphoma; myeloma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human bone marrow expressed probe encoded protein SEQ ID NO: 32364.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzhaimer's disease, multiple solerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                           Human, brain expressed exon, gene expression analysis, probe; microarray, Alzheimer's disease; multiple sclerosis, schizophrenia, epilepsy; cancer.
                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 31599.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The invention relates to a single exon nucleic acid probe (SBNP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. Associated secon encoded peptides of the invention. Note: The sequence lifermation for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human peptide encoded by genome-derived single exon probe SEQ ID 31538.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis;

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived cucleic acid probes for measuring gene expression in a sample derived from thuman lung comprising single exon nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 1218 complements or the 12387 open reading frames derived from the 1218 probes. Also included are a microarray comprising the novel set of probes conferences of the professed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a sample collection of detectably labeled nucleic acids derived from human lung measuring the label detectably bound to each probe of the array, identifying exons in a eukaryotic cange from genomic sequences of the eukaryote; and (b) measuring the label detectably bound to each probe of the entangent of detectably measuring the array of the expression of each of the exon probe in the above mentioned microarray assigning exons to a single exon probe in the above mentioned microarray assigning exons to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene, of comprising (a) identifying exons from genomic sequence by the method issues and/or call types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of exons should be assigned to a single gene, a peptide comprising of the exons in a gene, particularly using human companies. Or probes/open reading frames (ORF). The probes are used for gent expression of each of the exons in a gene particularly using human under the second or probes/open reading frames (ORF). The probes are used for gent expression of each of the exons should be assigned to a single gene, a peptide comprising of disease (ILD), familial diopathic pulmonary disease (CDP), interactivillar years of diseas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Spatially-addressable set of single exon nucleic acid probes, used to
pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       measure gene expression in human lung samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 27; SEQ ID NO 31538; 634pp; English.

ACF03547 to ACF03570 encode the human NOVX proteins (1) given in ABR57412 to ABR57435. (1) have cytostatic, cardiant, antinflammatory, nootropic, immunosuppressive, antiallergic, haemostatic, anti-HIV, antidiabetic, antiarterioscleroric, anorectic, antiasthmatic, nephrotropic, virucide, antiarthritic, hepatotropic, antiasthmatic, nephrotropic, virucide, antiparasitic, anticonvulsant, hypotensive, vasotropic, antiparkinsonian, vulnerary, angiogenic and antiangiogenic activities, and can be used in gene therapy and vaccines. The NOVX polypeptides and their antibodies can be used to determine the presence or absence of (1) in a sample. The NOVX

polypeptides, polynucleotides encoding them, and antibodies against them, are useful in manufacturing a medicament for treating or preventing a syndrome associated with a NOVX-associated disorder such as hypertension, cardiomyopathy, atherosclerosis, cancer, diabetes, asthma, inflammation, autoimmune disorders, allergies, blood disorders, obesity, acquired immunodeficiency syndrome (AIDS), immunoglobulin (Ig)A nephropathy, cirthosis, arthitis, Alzheimer's disease, Parkinson's disease, goite, infections (e.g. bacterial, viral, parasitic), stroke, muscular diseases. ACPO3571 to ACF03644 represent PCR primers and probes for NOVX sequence, which are used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; secreted protein; SECP; cytostatic; antiarteriosclerotic; anticonvulsant; nootropic; neuroprotective; cerebroprotective; anti-HIV; antiallergic; antiinflammatory; thyromimetic; gene therapy; cancer; cell proliferative disorder; atherosclerosis; neurological disorder; epilepsy; Huntington's disease; stroke; immune disorder; allergy; AIDS; inflammatory disorder; developmental disorder; hypothyroidism; Cushing's syndrome; infection.

ACC79026 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can ABR56726 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can have overceative, antiatrerisosclerotic, anticonvulsant, antialial ammatory, notropic, neuroprotective, cerebroprotective, anti-HIV, antiallergic and thyromimetic activities, and can be used in dagnosing, treating and preventing and polyvucleotides can be used in dagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of SECP, such as cell proliferative (e.g. expression or overexpression of SECP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and calculons. They are also useful in assessing the effections. They are also useful in assessing the effections or in a fragments are useful in screening compounds for effectiveness as agoing or antagonist of the polypeptides, or in altering the expression of the target polyuncleotide and compounds that specifically bind to or modulate the activity of the polypeptide
                   New human secreted proteins (SECP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant SECP expression e.g. cancer, AIDS, atherosclerosis, Huntington's disease, stroke, infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human, marker, expressed sequence tag; EST; arabidopsis; tumour; stress-induced phenotype; hyperosmotic stress; colon cancer; lmmunogen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADA83798 standard; protein; 166 AA.

The invention relates to a novel method for determining if a nucleic acid is a marker for a predetermined phenotype/cell type of interest from a biological species. The method comprises performing a global comparison of a group of expressed sequence tags (ESTS) known to be expressed in the phenotype/cell type of interest with all ESTs expressed in normal tissue of in order to identify ESTs that are preferentially expressed in the phenotype/cell of interest. A method of the invention is useful for determining whether a nucleic acid is a marker for a predetermined phenotype or cell type of interest from a biological species, preferably carbidopsis or human. The cell type of interest is an abnormal cell such as a tumour cell, and the predetermined phenotype is a stress-induced phenotype such as hypersometic stress or high salt conditions. A method of the invention is also useful for determining the progression of colon cancer in a human, for detecting a tumour cell, and for regulating or preventing the growth of a tumour cell, and for regulating or preventing the growth of a tumour cell. An antibody of the invention is useful as an end of the invention is useful as an end of immenogen for vaccinating a main animal. The present sequence represents a consecut of the invention is also useful as an animal. The present sequence represents a

The invention relates to the human atopic dermatitis-inducing proteins, salivary acidic proline-rich phosphoprotein (PRP; ADC98216) and prolactin cinducible protein (PIP) and their post-translationally modified forms. These proteins are secreted by salivary or sweat glands and bind to IgE autoantibodies, thereby activating mast cells and PRP or PIP; antibodies which bind to PRP or PIP, methods for diagnosing atopic dermatitis or for determining whether an individual is at risk of developing atopic dermatitis by determining the presence of PRP- or PIP-specific antibodies or immune complexes, or by quantifying histamine release; and sensitisation remedies for atopic dermatitis containing PRP and/or PIP or their peptides as the active ingredient. PRP, PIP and their an individual is at risk of developing atopic dermatitis. They whether an individual is at risk of developing atopic dermatitis. They are also useful in diagnosing atopic dermatitis containing proper are also useful in diagnosing sensitisation remedies for the treatment of atopic dermatitis. They active increases the specifically atopic dermatitis in the present sequence represents the specifically atopic dermatitis in the present sequence represents the specifically claimed human salivary acidic proline-rich phosphoprotein (PRP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.
                                                                                                                                                                                                                                                                                                                                                                  0; Gaps

US-09-252-991A-24480

Sequence 24480, Application US/09252991A

Sequence 24480, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO FSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ACRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-17

NUMBER OF SEQ ID NOS: 33142
